

CSCI-231 Server-side Development Assignment 7

To date the class has created a list of actions that the application should support and an ER diagram for the entities in the app.

You are now in a group with one member who participated in creating the ER diagram for the app.

In your group use the ER diagram and the list of actions to **design a set of schema** for the app. Do not create complete mongoose schema files, but rather **create a diagram** that shows all of your schema with the names and types of the properties in each schema.

The schema should support all of the actions in the actions list. If your group has issues with any the data in the actions list, **create a new list** of actions that your schema supports.

Delegate to one member of your group the responsibility to **email me your diagram** and actions list if applicable (no links please) by 9:00 am on Tuesday morning. **Include the names of all group participants** in the email.

Choose one member of your group to **demonstrate to class** on Tuesday your group's schema strategy and the reasons for choosing that strategy.

After each group has presented their group's diagrams, we'll vote as a class on one strategy to implement.
